Shifting Ground? State and market in the uplands of Northeast India

Landlessness and rural deprivation have historically been virtually absent in the uplands of Northeast India. Currently, due to the increasing presence of a monetised market oriented economy, rural destitution is becoming an everyday reality. Previously, jhum or swidden cultivation would produce subsistence crops such as rice in abundance, but in many places that is no longer the case. Steep population growth, increasing popular demand for cash and large-scale statist interventions have resulted in a growing pressure on jhum land. Forced by the substantial investments that the commercialization of agricultural production demands, and a need for cash more generally, jhum farmers are increasingly in need of credit, creating indebtedness and even alienation of land.

Erik de Maaker, Dolly Kikon & Sanjay Barbora

IN INDIA, shifting cultivation has been controversial for decades. To administrators, agronomists and conservationists, it has primarily been primitive, wasteful and inefficient. “(…) An extravagant and unscientific form of land use”, as some critics put it! Even as policymakers point out the precocious nature of this agricultural method, anthropologists and environmentalists have identified shifting cultivation as a technique that is exceptionally well suited for the uplands climate and soil, and ecologically sustainable. Obviously, growing population pressure, and the acquisition of land for other agricultural purposes, has reduced the viability of jhum cultivation. But even as the odds are against it, people make great efforts to continue the practice. Encroaching upon areas that were hitherto uncultivated, jhum farmers move towards steeper slopes, and less fertile plots.

How can this sustained commitment towards jhum farming be explained, particularly since an increasing number of studies also show that subsistence peasants are rapidly becoming landless daily wage labourers or migrant workers in urban centres across India? What can we learn from these developments regarding the radical transformations that the economies and societies of the uplands are subjected to?

The critics of shifting cultivation continue to be vocal and well represented both among policymakers and in the public domain, and quite a few government policies are in place intended to discourage it. Large-scale programmes have been initiated aimed at the expansion of capital-intensive commercial crops, such as rubber and tea, to improve the profitability of upland agriculture. In addition, and to some extent contradictory to these measures, over the last decades have over the last decades been subject to extensive extensions have over the last decades been subject to extensive increases in the period of several months, spreads the risk of a failed harvest. The sheer diversity of these crops, and their ripening over a period of several months, spreads the risk of a failed harvest. The critics of shifting cultivation continue to be vocal and well represented both among policymakers and in the public domain, and quite a few government policies are in place intended to discourage it.

The increasing state encirclement of the uplands of Northeast India has many consequences. As road connectivity improves, private educational facilities develop, and the electrical grid is extended, people increasingly aspire towards modernity. The conspicuous absence of the state as a service rendering entity, notwithstanding its overwhelming visibility as a security force in the region, has resulted in a growing presence of private players. Private health care, educational institutions, loan companies, and consumer agencies have produced a debt culture and rural populations across the hill states of Northeast India are increasingly becoming indebted and are mortgaging homes, jhum lands and crops in order to attend to health emergencies or children’s education, or to pay agents for securing jobs in urban centres across India and abroad.

The growing demand for cash is gradually drawing subsistence cultivators from the uplands deeper into a money and market oriented economy. In this new economy, they are becoming visible as the poor, dispossessed, and the landless. It is within this context that the ongoing state interventions to integrate the jhum uplands need to be examined. Particularly measures aimed at the promotion of plantation economy and the commercialisation of crops in the uplands appear to be dangerous since these undermine the political texture of local communities.

Jhum in the uplands

The uplands of the eastern Himalayas and its hilly southward extensions have over the last decades been subject to extensive “state-making”. This region, a single ecological zone, is criss-crossed by the international borders of India, China, Bangladesh and Burma/Myanmar. These states are actively consolidating their borders, and expanding their political and economic presence in the once semi- or ‘lightly’ administered uplands. Throughout these uplands, shifting cultivation has historically been an important economic activity.

Shifting cultivation, as the name suggests, is a method of farming on temporary fields. Throughout a growth season, one cycle; this cycle would previously encompass ten to fifteen years, increased population pressure and the pressure on the environment is increasing.

These states are actively consolidating their borders, and expanding their political and economic presence in the once semi- or ‘lightly’ administered uplands. Throughout these uplands, shifting cultivation has historically been an important economic activity.

Shifting cultivation, as the name suggests, is a method of farming on temporary fields. Throughout a growth season, which lasts for about six to eight months, the rain-fed fields carry both subsistence crops (such as maize, vegetables, pulses, rice, tubers) and cash crops (such as cotton, ginger, turmeric). The sheer diversity of these crops, and their ripening over a period of several months, spreads the risk of a failed harvest. The seeds are derived from previous harvests (no dependency on seed merchants), and many are unique varieties, that are well attuned to the specificities of soil and climate. The fields are abandoned after one or two years of cultivation, allowing shrubs and trees to grow back. People then cultivate a next plot. The alternation between periods of ‘cultivation’ and ‘fallow’ ensures the continuation of a jungle cover that helps to maintain biodiversity.” The larger the rotational cycle, the better the harvest. But where this cycle would previously encompass ten to fifteen years, increased population pressure and the pressure on the environment is increasing.

A major trend in the region is the creation of small-scale plantations that are permanently cultivated. This triggers the break-up of communal land tenure, replacing it by individual
ownership. The privatization of land titles provides individual upland cultivators with a valuable asset (land) that can be mortgaged, sold and inherited.8 Growing income disparities, land alienation, and out-migration are a consequence. On a different note, the growing popularity of new religious groups weakens the redistributive mechanisms embedded in society, resulting in communities becoming increasingly stratified along ethnic lines.

Although the distribution of resources such as land continues to be based on preceding social patterns, the current economic developments result in a redefinition of terms of entitlement. This is best articulated in those parts of Northeast India that are exposed to a substantial flow of capital, be it as part of large scale territorialized resource exploitation (hydroelectroclic dams, mining), the in-flow of development related money, or the increasing importance of plantation crops such as tea, coffee and rubber. While the initiatives aimed to increase the sustainability and profitability of shifting cultivation mentioned above extend to specifically benefit the rural poor, recent research suggests that even these projects inevitably contribute to the growth of income disparities.1

Towards a trans-regional perspective

Compared to Northeast India, shifting cultivators of the Chittagong Hill Tracts have very limited access to capital and markets, resulting in the perseverance of prior social and economic arrangements. The same holds for the Chin Hills of Burma/Myanmar, reputedly one of the most deprived regions of that country. There, people who depend entirely on swidden cultivation tend to be poor, but nevertheless have a high level of food security (as among the Konyak Naga, or in parts of the Chittagong Hills tracts), due to the variety of crops that can be harvested spread across many months. Does this explain the remarkable commitment of shifting cultivators to absorb ‘state’ efforts aimed at controlling their ‘traditional’ practices, and to continue with these against many odds?

Upland communities, as ‘state evaders’, have a history of self-governance.2 Their encasulation by the states of which they have become part in the course of the 19th and 20th centuries has resulted in complex legal configurations that encompass both customary laws as well as state laws. The extent to which localized customary arrangements are recognized at the state level differ significantly. For instance, official land records exist only for certain parts of the uplands. Where there are no land records, as in most of Arunachal Pradesh, but also in the Chittagong Hill Tracts and the Chin Hills, the state informally recognizes customary arrangements. Such arrangements are vulnerable, since they can easily be challenged when competing claims to land are advanced by commercial companies or the state. The contiguous uplands of Northeast India, Burma/Myanmar and the Chittagong Hills Tracts constitute the ‘last enclosure’3 perhaps the last area in the world that due to its earlier impenetrable terrain has remained outside the realm of state administrations, national laws, and the commercialization of natural resources. Bringing development to the uplands implies their integration in lowland oriented political and administrative schemes, and an opening up of their resources for national if not global extraction.

India, Bangladesh and Burma/Myanmar are advancing hegemonic claims over the uplands that have triggered the emergence of ethnic movements that counter these claims. In turn, this has resulted in (frequently violent) counter reactions from the various states. States have also confronted upland ethnicity in other ways. In India, government policies distribute resources for national if not global extraction. Such arrangements are vulnerable, since they can easily be challenged when competing claims to land are advanced by commercial companies or the state. 3 In November 2014 a group of concerned social scientists, NGO-related policymakers and journalists committed to the uplands met at the Tata Institute of Social Sciences in Guwahati, in an attempt to trace the impact of current developments on the uplands. Pooling expertise and knowledge beyond the boundaries of discipline and profession, the workshop aimed to locate gaps in the current perspectives on the uplands, and identify themes that demand urgent academic attention. Whereas most of the participants are involved with Northeast India, the presence of scholars working on the Chittagong Hill Tracts (Bangladesh) and the Chin Hills (Burma/Myanmar) allowed for an extension of the canvas to encompass the larger zone that these contiguous uplands constitute. The Indian Council for Social Science Research (ICSSR) and the Netherlands Research Council (NWO) sponsored the workshop under the ‘Social Science Scholar Exchange scheme’.
5 “State-making” in peripheral and disputed border zones such as Northeast India can be understood as ‘nationalising space’: political, administrative and economic integration achieved through the extension of state institutions, legal frameworks and developmental programs (Baruah, S. 2005. Durable Disorder: Understanding the Politics of Northeast India. Oxford University Press, p.38).
6 Northeast India is included in the Eastern Himalaya Biodiversity Hotspot, as defined by the influential US based NGO Conservation International (http://www.conservation.org/hotspots/hotspots.aspx)
8 The peripheral position of upland communities in relation to ‘states’ need not be seen as a being ‘left out’ of lowland based civilisations, but rather as the result of a conscious effort to remain as much as possible outside the sphere of influence of such states (Scott, J. 2009. The Art of Not Being Governed: An Anarchist History of Upland Southeast Asia. Yale University Press).
